In chemistry, a nonmetal (or non-metal) is a chemical element that mostly lacks metallic attributes. Physically, nonmetals tend to have relatively low melting and boiling points, and densities, are mostly brittle if solid, and are usually poor conductors of heat and electricity; chemically, they tend to have relatively high ionization energy, electron affinity, and electronegativity values ...

A metalloid is a type of chemical element which has properties in between, or that are a mixture of, those of metals and nonmetals. There is neither a standard definition of a metalloid nor complete agreement on the elements appropriately classified as such. Despite the lack of specificity, the term remains in use in the literature of chemistry.. The six commonly recognised metalloids are boron ...

Fig 2 . Schematic representation of PET principle. (A) After travelling in tissue (positron range) positron loses energy and annihilates with electron resulting in two 511 keV annihilation photons travelling in opposite directions; (B) Annihilation photons are registered externally by radiodetectors consisting of scintillation crystals and photomultiplier tubes and assembled in a ring.

Chromatographie sur l'élément et le corps simple, histoire et lexique. Le chrome appartenant au groupe 6 et la période 4 du tableau périodique fait partie de la famille des métaux de transition. Il fait partie du sixième groupe secondaire du tableau périodique, en un sens restreint du groupe chimique du chrome ou groupe VI B, qui comporte également le molybdène Mo, le tungstène W [8].

Alors que le corps simple manganésique n'est pas magnétique, le corps composé sulfate de manganèse, sous forme de cristaux incolores accumulés en poudre blanche, montre des propriétés magnétiques [8].. Le manganèse relativement abondant figure à la quatrième place des métaux usuels de nos sociétés modernes, après le fer, l'aluminium et le cuivre [9].
