Animals. An animal chimera is a single organism that is composed of two or more different populations of genetically distinct cells that originated from different zygotes involved in sexual reproduction. If the different cells have emerged from the same zygote, the organism is called a mosaic. Chimeras are formed from at least four parent cells (two fertilised eggs or early embryos fused together).

Online Courses and Texts Genetics at Kimball's Biology. Includes crossing over and genetic recombination in meiosis, gene mapping with three-point crosses, Mendel's monohybrid crosses, one gene--one enzyme theory, transposons: jumping genes.. Molecular Biology and Evolution: A large archive (mostly technical papers) from 18 years of Journal. Beginner's Guide to Molecular Biology: Students will ...

### **Evolution - Darwiniana**

Mendel's work suggested that just two alleles existed for each gene. Today, we know that's not always, or even usually, the case! Although individual humans (and all diploid organisms) can only have two alleles for a given gene, multiple alleles may exist in a population level, and different individuals in the population may have different pairs of these alleles.

The candidate gene approach to conducting genetic association studies focuses on associations between genetic variation within pre-specified genes of interest and phenotypes or disease states. This is in contrast to genome-wide association studies (GWAS), which scan the entire genome for common genetic variation. Candidate genes are most often selected for study based on a priori knowledge of ...
