In chemistry, molecular orbital (MO) theory is a method for describing the electronic structure of molecules. Electrons are not assigned to individual bonds between atoms, but are treated as moving under the influence of the nuclei in the whole molecule. The spatial and energetic properties of electrons are described by quantum mechanics as molecular orbitals surround two or more atoms in a ...

Chemistry is the scientific discipline involved with elements and compounds composed of atoms, molecules and ions: their composition, structure, properties, behavior and the changes they undergo during a reaction with other substances. In the scope of its subject, chemistry occupies an intermediate position between physics and biology. It is sometimes called the central science because it ...

Background. Metal-organic frameworks (MOFs) are made by linking inorganic and organic units by strong bonds (reticular synthesis). The flexibility with which the constituents' geometry, size, and functionality can be varied has led to more than 20,000 different MOFs being reported and studied within the past decade.

Carries water: Studies on water adsorption and transport on oxidized 2 D carbon materials have attracted increasing interest owing to their applications in various research fields such as sensing, energy conversion, and membrane separation. Herein, the recent progress on water adsorption and transport on oxidized 2 D carbon materials is reviewed, together with its application in proton ...

Welcome to the first national meeting of the Swedish Chemical Society! The meeting brings together more than 450 persons from all directions of chemistry represented within the society and offers a program of top plenary lectures, exciting specialized parallel sessions and plenty of room for interactions with meeting participants and exhibitors between scientific sessions.
