Signal processing is a subfield of mathematics, information and electrical engineering that concerns the analysis, synthesis, and modification of signals, which are broadly defined as functions conveying "information about the behavior or attributes of some phenomenon", such as sound, images, and biological measurements. For example, signal processing techniques are used to improve signal ...

The most common processing approach in the time or space domain is enhancement of the input signal through a method called filtering. Digital filtering generally consists of some linear transformation of a number of surrounding samples around the current sample of the input or output signal. There are various ways to characterize filters; for example:

This is an educational blog aimed at helping the reader understand the theory behind digital signal processing blocks used in digital communication transmitter and receiver. The theory is explained using classical text books as reference accompanied with simulation model using Matlab and/or Octave scripts.
