Solution Manual-Chemical Engineering Thermodynamics

In thermodynamics, a critical point (or critical state) is the end point of a phase equilibrium curve. The most prominent example is the liquid-vapor critical point, the end point of the pressure-temperature curve that designates conditions under which a liquid and its vapor can coexist. At higher temperatures, the gas cannot be liquefied by pressure alone.

Addition of reactants or products. For a reactional system at equilibrium: $Q_r = K_{eq}$; $\hat{I}_i = \hat{I}_i^{eq}$. If are modified activities of constituents, the value of the reaction quotient changes and becomes different from the equilibrium constant: $Q_r \neq K_{eq}$, $\Delta S_{tot} = \Delta S_{int} + \Delta S_{ext}$ and

The Second Law of Thermodynamics: Entropy and Evolution

Overall, the dielectric dependence follows directly from the large contribution of electrostatics to binding that exists in the gas phase. However, the electrostatic contribution to the stability of the receptor-anion complex becomes readily screened out in solution by the $1/\epsilon_r$ dependence. After the electrostatic contribution to the complex's solution stability drops to 50%, it passes ...
